(Received on May 8, 2004)

The taxonomy of *Coptis* Sect. Metacoptis Subsect. Japonocoptis (Ranunculaceae) is revised. As a result four species and a variety, including a new species and a new variety of *C. quinquefolia* described here are recognized. *Coptis minamitaniana* sp. nov. is characterized by its estoloniferous habit, chartaceous, quinquefoliolate leaves, solitary flowers, membranous nectary blades and obovate, cuspidate bracts. *Coptis minamitaniana* is distributed in the northern part of Miyazaki Prefecture and grows under evergreen broad-leaved trees. *Coptis quinquefolia* Miq. var. *shikokumontana* var. nov. is distinguished from the typical variety by its cup-shaped nectary blades and strongly recurved stigmata and is endemic to the Shikoku Mountains. The species of *Coptis* sect. Metacoptis subsect. Japonocoptis are enumerated in this paper.

Key words: *Coptis minamitaniana*, *Coptis quinquefolia* var. *shikokumontana*, Japan, new taxa, Ranunculaceae.

The genus *Coptis* sect. Metacoptis (Satake) Kadota subsect. Japonocoptis (Satake) Kadota is characterized by having white flowers and evergreen, quinquefoliolate basal leaves. Two species, *C. quinquefolia* Miq. and *C. ramosa* (Makino) Ohwi, are recognized in subsection (Kadota 2004). Taiwanese individuals belonging to the subsection have been ascribed to *C. quinquefolia* (Hsieh 1976, Ying 1978, Hsiao 1979, T. Y. A. Yang and Huang 1996, Y. P. Yang et al. 1999, Huang 2001).

In 1983 Mr. Tadashi Minamitani noticed that *Coptis* plants were cultivated in Miyazaki Prefecture, southern Japan, however, he could not locate them in the field at that time. The presence of the plants was confirmed by him at Kijō-cho, Koyu-gun of Miyazaki Prefecture in 1985. No *Coptis* plants had been reported from Kyushu Island

by the time of his discovery. At first he considered the plants to be *C. quinquefolia* (Minamitani 1986) and afterwards *C. ramosa* (Minamitani 2000). The author visited one of the localities of the *Coptis* plants under the guidance of Mr. Minamitani and made a field study of the plants there in October, 2003. Some flowering plants of the *Coptis* were also presented by him to the Herbarium, Department of Botany, National Science Museum, Tokyo (TNS).

The *Coptis* plants from Miyazaki Prefecture belong to subsection Japonocoptis because they bear white flowers and evergreen quinquefoliolate leaves. However, they could not be ascribed to any species hitherto known within the subsection in having chartaceous leaves, membranous nectary blades and obovate, cuspidate bracts. The subsection Japonocoptis was taxonomically

revised. As a result it was concluded that the *Coptis* plants from Miyazaki Prefecture should be attributed to a distinct new species. This new species is named here as *C. minamitaniana* after the original discoverer. The plants regarded as "*C. quinquefolia* Miq." from Shikoku Island, western Japan, were shown to be distinct from *C. quinquefolia* at a varietal rank in having cup-shaped nectary blades and strongly recurved stigmata. This entity is named here as *C. quinquefolia* var. *shikokumontana* because it is endemic to the Shikoku mountains. As a result of this revision it is clarified that the subsection is endemic to East Asia and consists of four species and a variety including a new species and a new variety of *C. quinquefolia* Miq.

The aims of this paper are to describe these two new taxa and to enumerate the species of genus *Coptis* sect. Metacoptis subsect. Japonocoptis.

Key to the species of *Coptis* sect.

Metacoptis subsect. Japonocoptis

1. Rhizome thin and long, stoloniferous; flowers solitary; petal blades fleshy
.....2. Petal blades saucer-shaped; stigmata erect or gently recurved3a. *C. quinquefolia* var. *quinquefolia*
2. Petal blades cup-shaped; stigmata strongly recurved3b. *C. quinquefolia* var. *shikokumontana*
1. Rhizome thick and short or relatively long, estoloniferous
.....3. Leaves chartaceous; flowers solitary; bracts obovate, cuspidate at apex; petal blades obovate, membranous1. *C. minamitaniana*
3. Leaves coriaceous; flowers 1–4, in a loose raceme; bracts narrowly ovate, acuminate at apex; petal blades rounded
.....4. Petal blades hemispherical, deep, membranous; terminal leaflets obovate to rhombic, shallowly pinnatilobed; bracts entire4. *C. ramosa*

4. Petal blades saucer-shaped, shallow, fleshy; terminal leaflets ovate to rhombic, coarsely serrate; bracts deeply trilobed to entire2. *C. morii*

Enumeration of the Species in *Coptis* sect. Metacoptis subsect. Japonocoptis

Coptis Salisb. in Trans. Linn. Soc. London **8**: 305 (1807).

Sect. **Metacoptis** (Satake) Kadota in K. Iwats. & al., Fl. Jap. **IIa**: (2004).

Subgenus *Metacoptis* Satake in J. Jpn. Bot. **24**: 73 (1949).

Subsect. **Japonocoptis** (Satake) Kadota in K. Iwats. & al., Fl. Jap. **IIa**: (2004).

Sect. *Japaonocoptis* Satake in J. Jpn. Bot. **24**: 73 (1949).

1. *Coptis minamitaniana* Kadota, sp. nov. [Figs. 1–2]

Coptis quinquefolia auct. non Miq.: Minamitani in Miyazaki-Shokubutsu-Kenkyûkai-Kaishi (2): 1–2, figs. 2–3 (1986).

Coptis ramosa auct. non (Makino) Tamura: Minamitani in Acta Phytotax. Geobot. **48**: 123, fig. 3 (2000).

Coptis quinquefolia Miq. var. *tenuis* H. Hara, in sched.

Haec species a *Coptidis quinquefoliae* habitu estolonifero; a *C. ramosae* floribus solitariis et bracteis obovatis cuspidatis; a *C. morii* floribus solitariis, bracteis obovatis cuspidatis et laminiis nectariorum membranaceis differt.

Herba perennis sempervirens scaposa, circiter 10 cm alta. Rhizoma crassum, relative longum, 3–4 mm in diametro, luteum, horizontale, estoloniferum. Scapus purpureo-brunneus, glaber, basi inclusus squamis ovatis crustaceis. Folia omnino basale, ambitu pentagono-cordatum, quinquefoliolatum, basi cordatum; foliola late obovatum vel rhombicum, 10–18 mm longum, 8–14 mm latum, chartaceum, leviter lucidum, trilobatum et incisum, aristatum, basi cuneatum, utrinque glabrum vel subtus

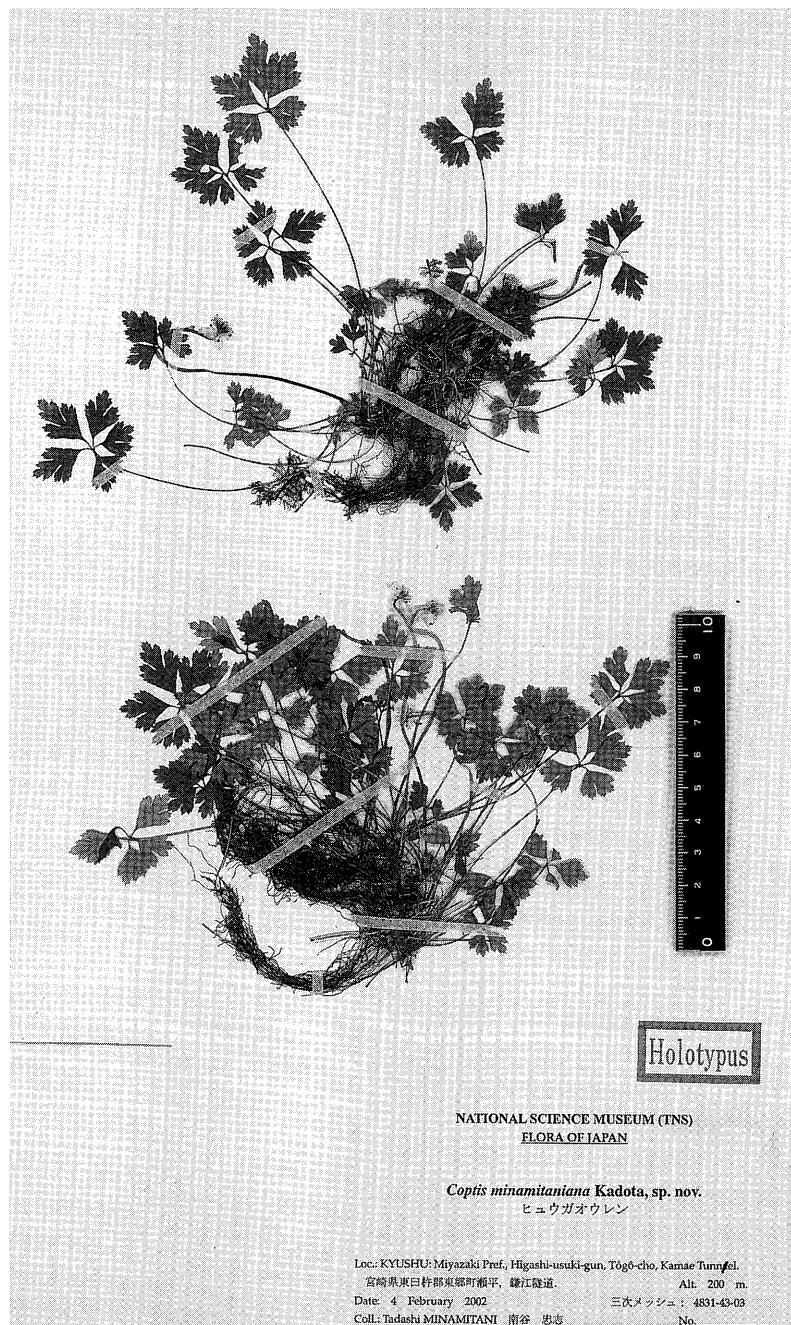

Fig. 1. Holotype of *Coptis minamitaniana* Kadota (JAPAN: Kyushu; Miyazaki Pref., Higashi-Usuki-gun, Tôgô-cho, Kamae Tunnel, 4 Feb. 2002, T. Minamitani s. n., TNS 728532).

strigosum; petioli 3–8 cm longus, glaber, basi breviter vaginatus. Flores in Januarii et Martii, solitari, 1–1.4 cm in diametro, unibracteati; bractae obovata, integra, circiter 2 mm longa, circiter 1.5 mm lata, cuspidata. Sepala 5, anguste ovata vel elliptica, 6–7 mm longa, 3–4 mm lata, alba, rotundata at apicem. Petala 5, spathulata, 3–4 mm longa, luteo-aurantiaca, stipitata; stipetes 2–3 mm longi; laminae circiter 1 mm longae, obovato-oblongae, membranaceae. Stamina 2–4 mm longa; antherae oblongae, circiter 0.5 mm longae; filamenta 1–3 mm longa, filiformia, leviter dilatata. Folliculi 5–9, ellipsoidei, 5–6 mm longi, circiter 2 mm lati, longe stipitati; stipites strigosi; rostra circiter 1 mm longa, uncinata; semina ignota.

TYPE: JAPAN: Kyushu; Miyazaki Pref., Higashi-Usuki-gun, Tôgô-cho, Sebira, Kamae Tunnel, alt. 200 m, 4 February 2002, fl., T. Minamitani s. n. (TNS 728532—holotype, Fig. 1; TNS 728531, 728533—isotypes).

Japanese name: Hyûga-ôren (nom. nov.).

An evergreen scapose perennial, ca. 10 cm tall, up to 15 cm at fruiting time. Rhizome thick and relatively long, 3–4 mm in diameter, branched, yellow, running horizontally, not stoloniferous. Scape purplish brown, glabrous, enclosed with ovate crustaceous scales at base. Leaves all basal, pentagonal-cordate in outline, quinquefoliate, cordate at base; leaflets broadly obovate to rhombic, 10–18 mm long, 8–14 mm wide, chartaceous and dully lustrous, medially trilobed and incised, aristate, cuneate, glabrous or sparingly strigose with short curved hairs along veins on the adaxial side, veins rising on the adaxial side; petioles 3–8 cm long, glabrous, shortly vaginate at base. Flowers in January to March, solitary, 1–1.4 cm in diameter, unibracteate; bract obovate, entire, circ. 2 mm long, circ. 1.5 mm wide, cuspidate. Sepals 5, narrowly ovate to elliptic, 6–7 mm long, 3–4 mm wide, white, rounded at apex. Petals 5, spathulate, 3–4 mm long, yellowish

orange, long stipitate; stipes 2–3 mm long; blades ca. 1 mm long, obovato-oblong, membranous. Stamens 2–4 mm long; anthers oblong, circ. 0.5 mm long; filaments 1–3 mm long, filiform, slightly dilated. Follicles 5–9, ellipsoidal, 5–6 mm long, circ. 2 mm wide, long stalked; stalks strigose with curved hairs; beaks less than circ. 1 mm long, hooked; seeds unknown.

Additional specimens examined: JAPAN; Kyushu, Miyazaki Pref., Koyu-gun, Kijô-cho, Kobutoko, 19 Oct. 1937, S. Yoshie s. n. (TI); Ishigawachi, alt. 100 m, along the River Komarugawa, 28 Jan. 1990, fl., T. Minamitani 34312 (TI), 30 April 2004, fr., T. Minamitani s. n. (TNS 728869–728870).

Coptis minamitaniana is distinguished from *C. quinquefolia* by the lack of stolons; from *C. ramosae* by having solitary flowers and obovate, cuspidate bracts; from *C. morii* by having solitary flowers, obovate, cuspidate bracts and membranous nectary blades.

According to the results of my field survey made on 30 October 2003 in Ishigawachi (alt. ca. 100 m), Kijô-cho, Koyu-gun, Miyazaki Prefecture, *Coptis minamitaniana* was found growing on mossy floors of evergreen broad-leaved forests comprised of *Carpinus laxiflora*, *Quercus glauca*, *Pourthiae villosa* var. *laevis*, *Eurya japonica*, *Pieris japonica*, *Adina pilulifera* etc.

Yamawaki M38-047 (MBK 0004610). Kôchi Oref., no precise locality, April 1960, fr., T. Yamanaka 18909 (TNS 282088).

Although the specimens from the Tsurugi Mountains and Mt. Higashi-Akaishiyama are

cited as *C. quinquefolia* var. *shikokumontana* in this study, those from the Ishizuchi Mountains, western Shikoku, were not examined here. However, “*C. quinquefolia*” has been reported from the Ishizuchi Mountains (K. Yamamoto 1936, Jin’no 1960, S. Yamamoto 1978). These plants hitherto known as “*C. quinquefolia*” are likely to be ascribed to this variety judging from the images from some web sites (e. g., <http://www6.plana.or.jp/saragamine/040221data.html>).

Mus., Tokyo (33): 72 (1953) – *Coptis ramosa* (Makino) Tamura in Acta Phytotax. Geobot. **17**: 118 (1958); in Satake & al., Wild Flow. Jap. **2**: 87 (1982), nom. superfl.

TYPE: JAPAN; Kagoshima Pref., Is. Yakushima, Sept. 1909, ste., T. Makino s. n. (MAK 095830–holotype; cf. <http://202.243.235.3/MakinoDB/makino/prep-j/MAK095830.html>).

Coptis quinquefolia Miq. var. *pedato-quinquefolia* Koidz. in Bot. Mag. Tokyo **37**: 39 (1923) – Masam., Fl. Geobot. Yakushima 190 (1934) – Satake in J. Jpn. Bot. **24**: 74 (1949) – Kitam. & Murata, Col. Illust. Herb. Pl. Jap. **2**: 214 (1961).

Japanese name: Ô-baika-ôren, Ô-gokayô-oren.

Distr.: Is. Yakushima, Kagoshima Pref. Endemic.

Specimens examined: JAPAN: Kyushu, Kagoshima Pref., Is. Yakushima, 4 Sept. 1910, Y. Nakano s. n. (TNS 28690); Isl. Yakushima, Aug. 1913, Y. Yoshii s. n. (TNS 388591); Is. Yakushima, 9 April 1954, M. Takeuchi s. n. (TI); Is. Yakushima, Shiratani-Unsuikyô, 27 March 1975, fl. & fr., A. Yamamoto s. n. (TNS 344098); Is. Yakushima, Kosugidani, 14 Aug.

1963, fr., T. Inobe s. n. (TKPM BSP042705); Is. Yakushima, Hanaegô, 24 March 1964, fl., N. Satomi s. n. (TKPM BSP032771, 048806); Is. Yakushima, Kosugidani, alt. ca. 750 m, ‘in planted *Cryptomeria japonica* forest’, 30 March 1966, fr., H. Ohba 662555 (TI); Is. Yakushima, Suzukawa, alt. 600 m, 27 Feb. 1968, y. fr., C. Chuma s. n. (TI); Is. Yakushima, Odakuni Valley, 3 March 1968, fr., H. Ohba 38 (TI); Is. Yakushima, Kosugidani–Kusugawa Forest Road, 14 March 1969, F. Konta 7463 (TNS 636592); Is. Yakushima, Kosugidani, 31 March 1975, young fr., C. Abe 50916, 50918 (TKPM BSP209302, 209303); Is. Yakushima, Shiratani-Unsui-kyô, alt. 620–900 m, 8 May 1984, fr., J. Murata & al. 17823 (TI); Is. Yakushima, Yakusugi-Land, 24 March 1985, fl., J. Sato s. n. (TI); Is. Yakushima, Mt. Aikodake, 9 April 1990, fr., K. Midorikawa & al. 904034 (TI).

I wish to give my sincere thanks to Mr. Tadashi Minamitani for his guidance and help the field collection in Miyazaki Prefecture, southern Japan, and for presenting specimens and beautiful photographs of the *Coptis* plants; to Dr. Makoto Ogawa for access to the *Coptis* specimens preserved at the Herbarium, Tokushima Prefectural Museum, Tokushima.

門田裕一：オウレン属ミツバオウレン節バイカオウレン亜節（キンポウゲ科）の分類学的再検討—日本産1新種と1新変種の記載—

オウレン属ミツバオウレン節バイカオウレン亜節 *Coptis* sect. *Metacoptis* subsect. *Japonocoptis* (キンポウゲ科) の分類学的再検討を行った。その結果、この亜節は日本と台湾に分布し、1新種ヒュウガオウレン *C. minamitaniana* Kadota とバイカオウレン *C. quinquefolia* Miq. の1新変種シコクバイカオウレン var. *shikokumontana* Kadota を含む、4種1変種から成ることを明らかにした。

ヒュウガオウレンは宮崎市の南谷忠志氏が1983年にその存在に気付き、1986年に確認したものである。同氏は本植物を、最初バイカオウレン *C. quinquefolia* Miq. と考え、後になって屋久島産のものと同一のオオバイカオウレン *C. ramosa* (Makino) Ohwi (この学名を用いることについては本文を参照されたい) とみなした。ヒュウガオウレンはストロンを出さないことでバイカオウレンとは明瞭に区別でき、オオバイカオウレンからは花が单生し、花茎につく苞の縁が切形となって先端が尾状に伸びる点で区別できる。台湾にはミンゲツオウレン *C. morii* Hayata があるが、ヒュウガオウレンは花が单生し、苞の先が尾状に伸びることのはかに、花弁の軸部が倒卵形で膜状になることでこれとは異なる。原 寛博士が東京大学所蔵の宮崎県産標本に裸名ながらウスババイカオウレン *C. quinquefolia* var. *tenuis* の名前を与えたよ

うに、ヒュウガオウレンの葉は質が薄いことも重要な特徴の一つである。ヒュウガオウレンはまた生育環境の点でも他のオウレン属植物と異なっている。2003年10月に同県児湯郡木城町（標高150 m 前後）で行った現地調査では、河川沿いのアラカシ、カマツカ、タニワタリノキ、アセビなどの常緑広葉樹林林内のコケの間に生育しているのが観察された。南谷氏による現地調査の結果からは、ヒュウガオウレンは宮崎県・尾鈴山西麓の標高100-500 m の範囲に分布しているものと推定されている。

バイカオウレンは本州では山形・福島両県の県境に位置する吾妻山から山口県・寂地山まで比較的広く分布するが、四国山地にも隔離的に分布している。今回改めて四国のものを検討したところ、花弁（蜜弁）の軸部がコップ状になり、柱頭が強く反曲する点で本州のバイカオウレンと異なることが明らかになった。そこで四国のものをバイカオウレンの新変種、シコクバイカオウレンとして記載した。

以上の結果にもとづき、オウレン属ミツバオウレン節バイカオウレン亜節の種は次のように区別される：

1. 根茎は細くかつ長く、ストロンを出す；花は花茎に单生する；花弁の軸部は肉質（広義の

バイカオウレン)

2. 花弁の舷部は皿状；花柱は直立あるいは緩やかに反曲するバイカオウレン（本州；山形県～山口県）
2. 花弁の舷部はコップ状；花柱は強く反曲するシコクバイカオウレン（四国山地）
1. 根茎は太くかつ短くあるいはやや長く、ストロンを出さない
 3. 葉は洋紙質；花は単生する；苞は倒卵形，先端は尾状に短く尖る；花弁の舷部は皿状，質が薄く肉質とはならないヒュウガオウレン（宮崎県）

3. 葉は革質；花は花茎に1-4花着く；苞は狭卵形，先端は漸尖形
 4. 花弁の舷部は半球形で深く，質が薄く肉質とならない；頂小葉は倒卵形～菱形，多少とも羽裂する；苞は全縁オオゴカヨウオウレン（屋久島）
 4. 花弁の舷部は皿状で浅く，肉質となる；頂小葉は卵形～菱形，粗い鋸歯がある；苞はしばしば3裂するミンゲツオウレン（台湾北部）
